Migration Highlights ♦ Second Quarter 2003

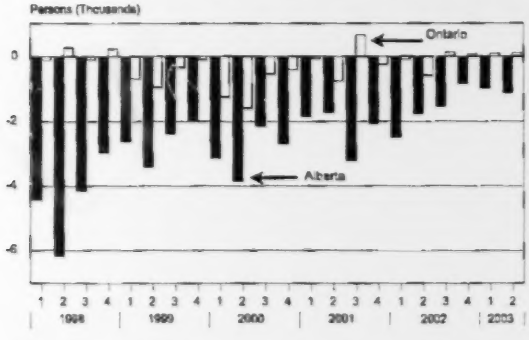
Please note that Statistics Canada, with the release of final 2001 estimates, has released revised Quarterly Components. Please note the changes in the attached Tables.

During the second quarter of 2003, B.C. gained an estimated total of 7,143 persons as a result of net migration from **all sources**. This compares to an increase of 6,002 in the second quarter of 2002. A decrease in the interprovincial outflow along with a slight increase in the net international inflow accounted for the increase.

There was a net outflow (1,140 persons) from B.C. to the **rest of Canada** in the second quarter of the year. This net outflow was considerably less then the same quarter of last year.

The net outflow of people to Alberta (-1,119 persons) in the second quarter is a continuation of the outflows experienced over the past six years. Aside from Alberta, there was little net movement between other regions of Canada and BC (after Alberta the largest outflow was to the Atlantic region (-162) and highest inflow from Ontario (92)).

BC Receives Net Inflow From Ontario



BC STATS

Net **international** migration to the province increased by 1.2% from the second quarter of last year, with a net inflow of 8,283 persons. Almost all of the increase resulted from an increase in non-permanent residents (students, persons on Minister's permits, etc). Even though immigration was down 6.3% and emigration remained at approximately the same level compared to the second quarter of 2002, B.C.'s share of immigrants increased considerably, from 14% in the 2002 second quarter to 16.2%. From the second quarter 2002 to 2003, Canada's net international migration dropped from 74,021 to 56,507. Some of this can be attributed to a slowing of immigrant application processing, rather than a decrease in the number of applicants.

The current quarter demonstrated a strengthening in interprovincial migration for B.C., as evidenced by the net outflow falling by almost one half from the second quarter 2002.

The population growth from the second quarter 2002 was 0.9% (the Canadian level was 0.8%.) Alberta (1.3%) and Ontario (1.2%) registered stronger annual population increases than B.C. However, the Yukon and Nunavut had higher growth, at 3.1% and 2.2%, respectively.

Population Growth
Second Quarter 2003

	(000s)
Population: April 1, 2003	4,135.8
Plus Interprovincial Arrivals	12.7
Minus Interprovincial Departures	13.8
Plus Immigrants	9.5
Minus Total Net Emigrants	2.4
Net Non-Permanent Residents	1.1
Plus Births	10.4
Minus Deaths	6.7
Population July 1, 2003	4,146.6

Feature Article: How many people were missed in the 2001 Census?

Summary

In each census, some Canadian residents are missed and some are counted more than once. Starting with the 1991 Census, Statistics Canada has made the decision to adjust the official population estimates to include a measure of net census undercoverage (persons missed less persons counted more than once). The population estimates in this report are based on information from the 2001 Census, adjusted for net census undercoverage.

After each census, Statistics Canada undertakes an extensive evaluation of the quality of the census using statistical methods to assess the coverage of the census. These coverage studies consist of the Reverse Record Check, which primarily measures **undercoverage**, and the Automated Match and Collective Dwellings studies, which measure overcoverage.

People are missed in the census for numerous reasons - households, such as those in secondary suites that are difficult for the enumerators to locate, difficulties in understanding the questionnaire, uncertainty about whether to include someone in a household, persons with no usual residence and a few people who refuse to participate in the census.

The Reverse Record Check (RRC) study selects a sample of approximately 60,000 Canadian residents, who should have been enumerated in the 2001 Census. These persons are selected from the following sources:

- persons enumerated in the 1996 Census;
- persons born between the 1996 and 2001 Censuses;
- immigrants who entered Canada between the 1996 and 2001 Censuses;
- persons who were not enumerated in the 1996 Census, as identified from the 1996 RRC;
- persons on work, student or ministerial permits and refugee claimants, who were in Canada on Census day (May 14, 2001);
- persons on Territorial Health Care Files (for Yukon and NWT only).

The sample represents the same target population as the census, but is obtained in such a manner as to be independent of the census itself. For each person selected in the sample, it must be determined if the person was enumerated in the 2001 Census, if so how many times and if not why not (e.g. the person died, left the country, was missed by the census,..). The RRC is a comprehensive record linkage and matching procedure, which systematically traces all persons in its sample, interviews them to obtain a census day address, and matches these persons to individual census documents.

Overcoverage in the census occurs when persons in the census target population are counted more than once, and when persons not in the target population (e.g. foreign residents, fictitious persons or pets) are enumerated. The first type of overcoverage can occur when a respondent fills out two census forms at different dwellings

Feature Article: How many people were missed in the 2001 Census?

or when two census questionnaires are delivered to the same household.

The Automated Match Study (AMS) is designed to detect pairs of similar households based on the number of persons matched between households (same sex and date of birth), the size of the two households and their relative proximity. Once pairs of similar households are detected, the census questionnaires for a sample of them are verified manually to determine the amount of overcoverage.

The Collective Dwelling Study (CDS) measures overcoverage of persons who are enumerated in both a private dwelling and also in a collective dwelling, such as a hospital, a hotel, or a student residence.

In addition to the AMS and CDS, overcoverage can also be detected by the RRC study.

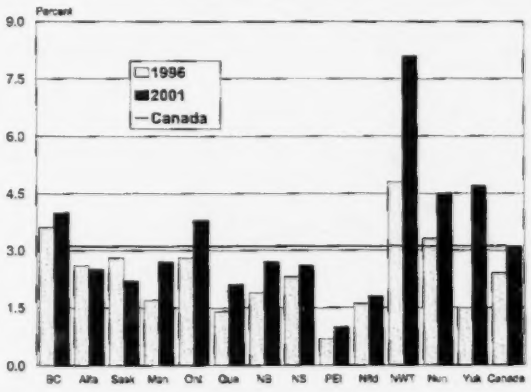
There is another category of missed, which the RCC can not adequately measure, namely **incompletely enumerated Indian reserves** and Indian settlements, where enumeration was not permitted or was interrupted before it could be completed, or where the quality of the data was considered inadequate. A regression model is used to estimate this category of missed people.

There are two other categories in which people may be missed, but for which there are no adequate estimates:

- **Returning emigrants**, Canadian citizens or landed immigrants who emigrated before the 1996 Census and returned to Canada to take up permanent residence prior to the 2001 Census;
- **Temporarily abroad**, Canadian citizens or landed immigrants who were temporarily abroad in 1996, did not have a usual place of residence in Canada, and returned to Canada prior to the 2001 Census.

The following chart shows the results of the 2001 Census coverage studies by Statistics Canada published on September 25, 2003. The 1996 net undercoverage rate is also shown for comparison purposes. Note that this rate has been revised from that previously published as a result of information obtained from the 2001 coverage studies.

In 2001 B.C. had a high undercoverage rate among the provinces.



The estimates indicate that in 2001 British Columbia had a net under-coverage rate that was much higher than that of other provinces. This situation is not unique, as in most

Feature Article: How many people were missed in the 2001 Census?

censuses B.C. has had a higher than average proportion of the population that was missed. Some of the factors that may contribute to the high rate are the remoteness of some areas of the province, the high mobility of the population and the large number of recent immigrants, in particular those from non-English speaking countries. All of these factors tend to make the population more difficult to locate and enumerate successfully.

From the table below it can be seen that the Census of 1991 was somewhat of an anomaly. The net undercount for B.C. was about the same as the national average, while in 1981, 1986, 1996 and 2001 the rates were relatively high. The 1991 result may have been partially a result of a special census undercount project that was initiated jointly by BC Stats and Statistics Canada prior to the 1991 Census. The purpose of this project was to improve the coverage of the census itself by developing an address file of dwellings using administrative records from many sources and also by compiling better geographical information on the location of addresses. A similar project was not undertaken for either the 1996 or the 2001 Census, and the higher undercoverage rates may be part of the consequences.

Estimated Census Coverage Error (%)
(2001 Figures Based upon the Reverse Record Check)

*Pre-1996 figures represent combined NWT and Nunavut

Feature Article: How many people were missed in the 2001 Census?

If we look at the Census Metropolitan Areas (CMAs), the Net Undercoverage rates from the RRC for all CMAs across Canada was 3.15%, and 2.70% for the non-CMA areas. In BC the CMAs have considerably higher net undercounts then the national level, as can be seen in the following table.

2001 Estimated CMA Net Undercoverage
All CMA (Canada): 3.15%

Abbotsford	5.44%
Vancouver	3.86%
Victoria	3.94%

It should also be noted that coverage errors are extremely variable by age and gender (see the following RRC table and graph). Thus the net undercoverage rates by region within BC may potentially vary considerably depending on the region's age/gender structure.
